PIA

My PIA is related abut the system that can be used in a bookstore. I'll try to include basic functions that the bookstores need. In this case my hypothetical bookstore only does loans.

What I'm thinking to do is that I can program a code where you got these options:

1. Include a stock of books
2. New loan
3. Loan register

The number 1) is related about the bookstore can register books, like 34 new books, but these books must be the same article.

Number 2) is to make a loan to some person. You introduce the name, the book you're goanna loan, the date you're doing the loaning and finally, the date the loaning it's up.

Number 3) is the part where you can see the people you've loaned books, the name, the book that person has and the first date of the loan and the last day for this.
